

BioBoost is used to provide improved growth and vigour and to enhance resistance to heat, cold and drought stresses.

BioBoost contains a mixture of bioactive compounds and minerals principally from renewable and sustainable natural resources.

BioBoost contains 7 principal amino acids, along with a further 11 amino acids, betaines, other organic acids and natural plant hormones (auxins, cytokinins and gibberellins).

The formulation aids the uptake and redistribution of nutrients within the plant, promotes root initiation and growth stimulation while also improving drought resistance.

### Photosynthetic area

Increases the photosynthetic area through increased leaf and shoot growth.

### Increased Carbohydrate

Increases plant carbohydrate production and sugar content.

### Direct Application

Direct application = direct absorption and immediate use. Proven & practiced fertilisation technology.

### Weather stresses

Improves resistance to heat, cold and drought stresses.

## Increases a crops carbohydrate production

Boosting yields and quality

## Supports increased leaf growth and photosynthetic area

Allowing crops to make the best use of available sunlight

## Easy to Use

Can be used along side other plant protection products.

## Recommendation

0.5 l/ha
