

BioZest is used to provide enhanced photosynthetic performance which aids growth and vigour along with increasing resistance to heat, cold and drought stresses.

Containing a mixture of bioactive compounds and minerals principally from renewable and sustainable natural resources.

With seven principal amino acids, along with a further eleven amino acids, betaines, other organic acids and natural plant hormones (auxins, cytokinins and gibberellins).

The formulation aid the uptake and redistribution of nutrients within the plant, promotes root initiation and growth stimulation while also improving drought resistance.

Photosynthetic performance

Improved photosynthetic performance and efficiency, making best use of dull days.

Increase photosynthetic area

Increases leaf and shoot growth.

Direct Application

Direct application = direct absorption and immediate use. Proven & practiced fertilisation technology.

Weather stresses

Improves resistance to heat, cold and drought stresses.

Can be used on all crops and no statutory harvest intervals

Supports increased leaf growth and photosynthetic efficiency

Allowing crops to make the best use of available sunlight

Easy to Use

Can be used in tank mix with crop protection products.

Recommendation

0.5 l/ha 120l of water
